                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
permease II and a putative human tumour suppressor.";

Trends Biochem. Sci. 19:19-19(1994).

-!- FUNCTION: UPPARE OF SULFATE INTO THE CELL.

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- INDUCTION: Highly expressed, but only in cells subject to sulfur limitation, and it is turned on by the positive-acting Cys-3 sulfur regulatory protein.

-!- MISCELLANGOUS: SULFATE PERMEASE II IS MAINLY FOUND IN MYCELIA.

-!- SIMILARITY: Belongs to the SLC26A/SulP transporter (TC 2.A.53)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SEQUENCE FROM N.A.

The complete sequences of 100 new cDNA clones from brain which can code for large proteins in Virco.";

DNA Res. 5:31-39(1998).

--- CATALYTIC ACTIVITY: ATP + H(2) = ADP + phosphate.

--- CATALYTIC ACTIVITY: ATP + H(2) = ADP + phosphate.

--- CATALYTIC ACTIVITY: Midely expressed, with highest levels in kidney, followed by lung, brain, prostace, testis, ovary and small intestine.

--- DISEASE: Defects in ATP10A are a cause of Angelman syndrome (AS)

--- CHARLYTIC ACTIVITY: Midely expressed, with highest levels in characterized by leatures of severe motor and intellectual characterized by features of severe motor and intellectual retardation, microcephaly, ataxia, frequent jerky limb movements and flapping of the arms and hands, hypotonia, hypotonia, hypotonia, hypotonia, hypotonia, hypotonia, hypotonia, hypotonia, and episodes of paroxysmal laughter, and an unusual facies characterized by macrostomia, a large mandible and open-mouthed characterized by and an occipilatel groove.

--- SIMILARITY: Belongs to the cation transport ATPases family (P-type
                                                                                                                                                                    SECTIONS FROM N.A.

                                                                                                                                                                                                                                                                              Mycoplasma pulmonis.";

Nucleic Acids Res. 29:2145-2153(2001).

-I-FUNCTION: This protein binds directly to 23s ribosomal RNA and is necessary for the in vitro assembly process of the 50s ribosomal subunit. It is not involved in the protein synthesizing functions of that subunit (By similarity).

-I- SIMILARITY: Belongs to the L20P family of ribosomal proteins.

-!- SUBUNIT: Monomer (By similarity)
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the EPSP synthase family.
-!- SIMILARITY: Belongs to the EPSP synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Schizosaccharomyces pombe (Fission yeast).

invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                         /note= "Norvalyl carbonyl forming keto-amide linkage with residue 7"

```

The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C virus Claim 17; Page 65; 69pp; English.

Sequence 11 AA

ö ö /note= "Norvalyl carbonyl forming keto-amide linkage with residue 7" ingredient ō The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of invention are alpha-ketcamide peptide analogues. The peptides have viruside activity, and are useful for treating and in the manufacture a medicament to trat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredicts useful for treating disorders associated with hepatitis C virus Gaps Gaps Hepatitis C virus; HCV; serine protease; inhibitor; alpha-ketoamide; Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C Hepatitis C virus NS3/NS4a serine protease inhibitor peptide #40. ö ö DB 5; Length 11; 0.00071; hes 0; Indels Length 11; 0; Indels 96.4%; Score 54; DB 5; Le 100.0%; Pred. The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                      /note= "Norvalyl carbonyl forming keto-amide linkage with residue 7"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ptide compound having hepatitis C virus protease inhibitory useful for treating disorders associated with hepatitis C virus
                                                                                             Hepatitis C virus; HCV; serine protease; inhibitor; alpha-ketoamide; virucide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatitis C virus; HCV; serine protease; inhibitor; alpha-ketoamide;
                                                                        Hepatitis C virus NS3/NS4a serine protease inhibitor peptide #17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus NS3/NS4a serine protease inhibitor peptide #21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           87.5%; Score 49; DB 5; Length 11; 90.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                          The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                      /note= "Norvalyl carbonyl forming keto-amide linkage with residue ?"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have viruidide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

The sequence represents a peptide compound of the invention having hepatitis C virus (RCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                 Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis C virus; HCV; serine protease; inhibitor; alpha-ketoamide;
virucide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis C virus NS3/NS4a serine protease inhibitor peptide #30.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABB80550 standard; peptide; 11 AA.

                                                                                                               The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV procease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus

Hepatitis C virus NS3/NS4a serine protease inhibitor peptide #41

08-OCT-2002

ABB80561;

á

```
The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketoamide peptide analogues. The peptides havingide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A
                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "Norvalyl carbonyl forming keto-amide linkage with residue 7"

The peptides of the invention are alpha-ketoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composation comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                  Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus NS3/NS4a serine protease inhibitor peptide #1.

The sequence represents a peptide compound of the invention having hepatitis C virus (HCV) protease inhibitory activity. The peptides of the invention are alpha-ketcoamide peptide analogues. The peptides have virucide activity, and are useful for treating and in the manufacture of a medicament to treat disorders associated with HCV protease. A pharmaceutical composition comprising the peptide as an active ingredient is useful for treating disorders associated with hepatitis C virus
                                                                                                        /note= "Norvalyl carbonyl forming keto-amide linkage with residue 7"
                                                                                                                                                                                                                                                                                                                                                                             Novel peptide compound having hepatitis C virus protease inhibitory activity useful for treating disorders associated with hepatitis C virus protease.

| GENERAL INFORMATION:
| APPLICANT: Seldmen, Robert A. |
| APPLICANT: Schleper, Christa |
| APPLICANT: Schleper, Christa |
| TILL OF INVENTION: NUCLEIC ACIDS AND PROTEINS FROM CENARCHAEUM SYMBIOSUM FILE REFERENCE: DCORP.002A |
| CURRENT APPLICATION NUMBER: US/09/408,020 |
| CURRENT APPLICATION NUMBER: 60/102,294 |
| PRIOR PLIING DATE: 1998-09-29 |
| PRIOR PLIING DATE: 1998-09-29 |
TITLE OF INVENTION: by the polynucleotides and methods for their use.
FILE REFERENCE: 11000.105001
CURRENT PELLICATION NUMBER: US/09/724,864
CURRENT FILING DATE: 2000-11.28
FRIOR PELLING APPLICATION NUMBER: U.S. No. 6380362 60/171,678
FRIOR FILING DATE: 1999-12-23
NUMBER OF SEQ ID NOS: 72
SOFTWARE: FastSEQ for Windows Version 4.0

Batent NO. 6551795

GENERAL INFORMATION:
APPLICANT: Marc V. Rubenfield et al.
APPLICANT: Marc V. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136

CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 27834

Publication No. US20020068702A1

GENERAL INFORMATION

GENERAL INFORMATION

APPLICANT: Lim-Wilby, Marguerita

APPLICANT: Lewy, Odile B

TITLE OF INVENTION: NOVEL PEPTIDES AS NS-3-SERINE PROTEASE INHIBITORS OF HEPATITIS C

FILE REFERENCE: INO1192-US

CURRENT APPLICATION NUMBER: US/09/909,164

CURRENT PILING DATE: 2003-03-25

PRIOR APPLICATION NUMBER: 60/220,101

PRIOR PILING DATE: 2000-07-21

NUMBER OF SEQ ID NOS: 62

SOFTWARE: PATENTING DATE: 2000-07-21

NUMBER OF SEQ ID NOS: 62

SED ID NO 5

LENGTH: 11

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- CATALYTIC ACTIVITY: 2 ATP a Lightramine + CO(2) + H(2)O = 2 ADP +
phosphate + L-glutamate + carbamoyl phosphate.

-!- COFACTOR: Binds 3 manganese ions per subunit (By similarity).

-!- PATHWAY: Arginine biosynthesis.

-!- PATHWAY: Pyrimidine biosynthesis, first step.

-!- PATHWAY: Composed of two chains; the small (or glutamine) chain promotes the hydrolysis of glutamine to ammonia, which is used by the large (or ammonia) chain to synthesize carbamoyl phosphate (By

EN REAL PROSPHATE SYNTHETIC DOMAIN.

A 10 CARBAMOYL PHOSPHATE SYNTHETIC DOMAIN.

CARBAMOYL PHOSPHATE SYNTHETIC DOMAIN.
PATHWAY: Pyrimidine biosynthesis; first step.
SUBUNIT: Composed of two Chains; the small (or glutamine) chain promotes the hydrolysis of glutamine to ammonia, which is used by the large (or ammonia) chain to synthesize carbamoyl phosphate (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gape

T. Complete genome sequence of Methanobacterium thermoautotrophicum
RT deltaH: functional analysis and comparative genomics.";
J. Bacteriol. 179:7135-7155(1997).
J. FUNCTION: Required for the methylation step in diphthamide
Diosynthesis (By similarity).
C. I. CARALYIIC ACTIVITY: S-adenosyl-L-henthionine + 2-(3-carboxy-3-aminopropyl)-L-histidine = S-adenosyl-L-homocysteine + 2-[3-carboxy-3-(methylammonio)propyl]-L-histidine.
C. I. PATHWAY: Diphthamide biogynthesis, second step.
J. SIMILARITY: Belongs to the diphthine synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Brotein translocation process in the yeast Yarrowia lipolytica.";
J. Biol., Ghem. 271-11668-11675(1996).
-i- FUNCTION: Involved in the protein translocation process. May interact directly with translocating polypeptides to facilitate their transfer and/or help their folding in the ER. It is not required for viability but is essential for optimal growth at elevated temperatures.
-i- SUBCELLULAR LOCATION: Endoplasmic reticulum lumen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE FROM N.A.

Fontecilla-Camps J.C.;

"Removal of the bridging ligand atom at the Ni-Fe active site of linkel hydrogenase upon reduction with H2, as revealed by X-ray structure analysis at 1.4-A resolution.";

Structure 7:557-566(1999);

-!-COPALYITIC ACTIVITY: H(2) + acceptor = 2 H(+) + reduced acceptor.

-!-COPACTOR: Nickel, 2 irrom and selenocysteine. Iron 1 has three cyanide and carbon monoxide ligands. Iron 2 has three water ligands.

-!-COPACTOR: Nickel, 2 irrom and selenocysteine. Iron 1 has three cyanide and carbon monoxide ligands. Iron 2 has three water ligands.

-!-COPACTOR: Nickel, 2 irrom and selenocysteine. Iron 1 has three cyanide and carbon monoxide ligands. Iron 2 has three water ligands.

-!-SUBUNIT: Heterodimer of a large and a small subunit.

-!-SUBCELIANEOUS: PERHAPS THE LEADER OF THE SMALL SUBUNIT SERVES AS A TRANSPORT VEHICLE FOR BOTH SUBUNITS.

-!-SIMILARITY: Belongs to the [NiFe]/[NiFeSe] hydrogenase large subunit family.
                                                                                                                                                                                                                                                                                                                                           EMBL; M18271; AAA23375.2; -.

It is required for dam-dependent methyl-directed DNA mismatch repair. May act as a "molecular matchmaker", a protein that promotes the formation of a stable complex between two or more promotes the formation of a stable complex between two or more DNA-binding proteins in an ATP-dependent manner without itself being part of a final effector complex (By similarity). SIMILARITY: Belongs to the DNA mismatch repair mutl/hexB family.
